VIGRI — LITEPAPER v0.3

October 2026

1. Project Overview

VIGRI is an application project for sports and dance clubs, creative groups and independent creators. Its purpose is to help people discover initiatives that interest them, participate in community life and support their development, including financially.

The main focus is to build an application where clubs and creators can present their activities, engage with their audiences and offer clear ways to participate and provide support.

VIGRI is intended for:

- professional and amateur sports clubs;
- ballet schools and dance studios;
- creative groups and independent creators;
- fans, audiences and anyone interested in the activities of these participants.

For fans and community members, the application is intended to provide opportunities to:

- discover clubs, creators and projects and follow their activities;
- support selected initiatives directly;
- participate in events, shared activities and fundraising for specific purposes;
- access meetings, training sessions, trips, merchandise and other offerings from clubs and creators.

For clubs, studios and creators, the planned features include:

- a dedicated page with information about their activities, events, goals and offerings;
- tools for ongoing engagement with their audiences;
- additional funding opportunities through community support, sales and targeted fundraising;
- opportunities to collaborate with other project participants.

These features describe the application concept and will be introduced as development progresses.

NFTs and the VIGRI Token

VIGRI NFT cards provide a way to support the project's development and record early participation. They include rights to receive VIGRI tokens through Claim, subject to the terms of the relevant category. Collectible and game mechanics also remain part of the project concept.

The project's own **$VIGRI** token on the Solana blockchain is intended as a tool for participation, rewards and financial support within the project. Its use within the application has yet to be implemented.

Connection to Lumiros and the Long-Term Vision

VIGRI is being developed as part of the long-term vision for the **Lumiros** ecosystem, bringing together digital services, communities and real-world projects.

A separate long-term objective is to establish an **International Sports and Dance Training and Rehabilitation Centre** on the coast of the Gulf of Finland in Estonia. At this stage, it remains a concept whose implementation will require resources, partners and further development.

---

2. Vision and Mission

Mission

To help sports and dance clubs, creative groups and independent creators develop through direct connections with their communities and clear ways to participate and provide financial support.

VIGRI aims to make this connection useful to both sides: giving clubs and creators more opportunities to realise their ideas, while allowing fans and audiences to be closer to those they support and see the results of their participation.

Vision

A community where a local studio, a professional team or an independent creator can find like-minded people, develop an audience and receive support for specific goals.

Within this community:

- clubs and creators openly share their activities, needs and results;
- fans and audiences choose initiatives they care about and ways to participate that suit them;
- partners and sponsors find projects for collaboration and targeted support;
- shared events, offerings and initiatives help build lasting relationships.

The VIGRI application is intended to provide a convenient foundation for this interaction. Blockchain, NFTs and the VIGRI token are intended to complement it where they help record participation, verify the movement of funds and implement the terms of support and rewards.

---

3. The Problem

The VIGRI concept addresses several practical difficulties that sports and dance clubs, creative groups and independent creators may face.

- **Unstable funding**

  Income from classes, performances, tickets and sponsorship may fluctuate, while rent, equipment, travel and other expenses require regular funding. Dependence on individual sponsors or founders' personal contributions makes long-term planning more difficult.

- **Fragmented audience engagement**

  News, discussions, schedules, offerings and fundraising are often spread across different services. Participants have to look for information in several places, while organisers have to maintain these channels and manually connect enquiries, payments and agreements.

- **A lack of clear ways to participate**

Interest in a club or creator does not always develop into an ongoing relationship. People may be unsure how to help a particular project, join an event or provide regular support. Accessible offerings, clear terms and feedback are needed to make this possible.

- **Insufficient transparency about goals and results**

  People want to understand what funds are being raised for, how much has been collected and what has been achieved. When goals, receipts and results are scattered or rarely updated, it becomes harder to assess the value of their participation.

Existing social networks, payment services and crowdfunding platforms address individual parts of these challenges. The VIGRI concept brings together the presentation of activities, communication, offerings and support in one application, with clear terms and accessible information about results.

---

4. The VIGRI Platform: The Solution

VIGRI is conceived as a specialised messaging application and social network for sports, dance and the arts.

The application centres on private and group communication, posts and communities built around clubs, studios, teams and creators. Participants will be able to exchange messages, share news and achievements, discuss events, find like-minded people and stay in regular contact.

Clubs and creators will be able to bring their audiences together in their own communities, share their everyday activities, coordinate joint initiatives and receive feedback. For fans and audiences, this provides a way to be closer to the life of a team or creative project and communicate with other participants.

Tools for financial support are intended to form an important part of this environment: paid offerings, sales of goods and services, pre-orders, sponsorship and targeted fundraising. The **$VIGRI** token and NFTs are planned as additional tools for participation and rewards, whose integration into the application has yet to be implemented.

4.1. What Fans and Community Members Gain

The application is planned to support everyday communication through:

- private and group chats with other participants;
- following clubs, teams and creators and viewing their posts and news;
- discussing matches, performances, training sessions and creative work;
- sharing photographs, experiences and personal achievements;
- finding like-minded people and organising shared activities.

Clubs and creators will be able to complement this communication with specific offerings:

- club merchandise and creator-made products, including pre-orders;
- places on team trips to tournaments and events;
- meetings, photo sessions and opportunities to go behind the scenes;
- participation in training sessions, classes and workshops;
- digital collectibles and NFTs;
- special content for their communities;
- statuses and forms of recognition, such as “Fan of the Month” or “Tournament Sponsor”;

- other events and initiatives created together with participants.

Users will also be able to support selected clubs and creators, participate in targeted fundraising and follow the results. The range of offerings, their availability and participation terms will be determined by the relevant organiser.

4.2. What Clubs, Studios and Creators Gain

The following tools are planned for community organisers:

- **A dedicated page and community** — history, team members, creative work, achievements, news and offerings in one place.
- **Ongoing audience engagement** — posts, discussions, private and group chats, and feedback from participants.
- **Event coordination** — announcements, discussion of organisational matters and communication with participants in training sessions, performances and trips.
- **Shared activities** — challenges, themed discussions, campaigns and common goals that help sustain interest in community life.
- **Sales of goods and services** — merchandise, original work, classes, meetings and other offerings, including pre-orders.
- **Financial support** — sponsorship and targeted fundraising for equipment, travel, productions, training facilities and other projects, with published goals and results.
- **Collaboration and new connections** — finding partners, developing joint initiatives with other clubs and creators, and gaining additional visibility within the Lumiros ecosystem.

The economic model envisages the use of **$VIGRI** to pay for offerings, provide support and distribute rewards, as well as the ability to hold received tokens in a personal wallet. These mechanisms have yet to be integrated into the application.

---

5. VIGRI NFT Cards: Participation and Project Support

VIGRI NFT cards on the Solana blockchain provide a way to support the project's development and record early participation in VIGRI and the Lumiros ecosystem. NFT sales help fund work on the project, whose main focus is to create an application for communication and interaction in sports, dance and the arts.

The NFT card model includes:

- the right to receive a specified number of VIGRI tokens through Claim;
- additional participation opportunities under the terms of the category;
- a digital collectible component and, for certain categories, a physical collectible component;
- collectible and game mechanics: rarity levels, Mystery Box, DUO / TRIO / QUATTRO codes and WS-key.

NFTs are already being minted. Original designs, the collection reveal and related additional mechanics are being developed as the project's resources allow. Participation terms must be distinguished from the actual readiness of individual features.

5.1. Basic Principle

When the initial economic model was prepared, each NFT category was assigned a notional participation value in euros, such as €50, €150 or €1,000.

These values are used to establish the relationships between categories and calculate the number of tokens allocated to them. The model reference value is **€0.0008 per VIGRI**.

Under the current sales model, NFT prices are set **in SOL**. Their euro equivalent depends on the SOL/EUR exchange rate at the time of purchase and may differ from the original notional participation value.

Accordingly:

- **The notional value in euros** is an economic model parameter, not a cash balance held by the NFT or an amount due for repayment.
- **The purchase price** is determined in SOL.
- **The Claim entitlement** is a specified number of tokens for each category and is not recalculated when the SOL/EUR exchange rate changes.
- **€0.0008** is a calculation value, not an established market price or a promise of the token's value after trading begins.

Certain categories include **discount vouchers** — rights to purchase additional VIGRI at a discount to the market price after TGE. Here, TGE refers to the stage at which token distribution and related mechanisms are launched, rather than the act of issuing the tokens: 10 billion VIGRI have already been issued.

Claim and vouchers represent different rights: receiving the specified number of tokens and purchasing additional tokens on special terms. Their use is governed by the terms of the relevant category.

This model makes it possible to define participation terms in advance and separate them from fluctuations in the SOL price and the future market value of VIGRI.

5.2. Mystery Box and Reveal Model

The **Mystery Box** format involves minting NFTs with temporary images, followed by the disclosure of their final designs and collectible attributes through **Reveal**.

Creating original images and revealing the collection remain development tasks. Reveal will depend on the readiness of the collection and the necessary technical mechanisms; this version of the document sets no fixed date.

The Bronze, Silver, Gold, Platinum and WS-20 categories include planned **Common / Rare / Ultra** rarity levels. These relate to the design, physical collectible component and status. Rarity alone does not increase the basic Claim entitlement, which is determined by the NFT category.

After Reveal is completed, the collection's metadata is intended to become **immutable**. This is a planned stage, not a statement about the current state of all NFTs.

5.3. Categories: Brief Overview

The supplies and basic parameters of the categories are listed below. Claim entitlements are calculated using the reference value of **€0.0008 per VIGRI**.

KYC identity verification requirements depend on the NFT category and the applicable participation terms. The **vesting** envisaged for higher-tier categories has not yet been technically implemented.

1. Tree / Steel — combined supply: 2,000 NFTs

- Choice of visual archetype: Tree or Steel; the economic terms are identical.
- **Claim: 62,500 VIGRI per NFT.**
- No physical card is included.
- Unique serial number.
- The base category of the VIGRI collection.

2. Bronze — supply: 1,000 NFTs

- **Claim: 187,500 VIGRI per NFT.**
- Includes a planned voucher to purchase additional VIGRI at a **25% discount** for a limited period after TGE.
- The category model includes early access to Lumiros services as they become available.

3. Silver — supply: 200 NFTs

- **Claim: 1,250,000 VIGRI per NFT.**
- Part of the Claim entitlement is subject to planned vesting — receiving tokens gradually.
- Includes a planned voucher to purchase additional VIGRI at a **35% discount**.
- Several design options and a physical card upon request.
- A **DUO code** system is planned for joint activations by participants.

4. Gold — supply: 100 NFTs

- **Claim: 6,250,000 VIGRI per NFT.**
- Token distribution is subject to planned vesting.
- Includes a planned voucher to purchase additional VIGRI at a **40% discount**.
- Unique design and numbering; a physical card is included in the category terms.
- A **TRIO code** system is planned for joint activations by three participants.
- Includes expanded access to Lumiros services and activities as they become available.

5. Platinum — supply: 20 NFTs

- **Claim: 12,500,000 VIGRI per NFT.**
- Token distribution is subject to planned vesting.
- Includes a planned voucher to purchase additional VIGRI at a **50% discount**.
- Collectible physical card.
- A **QUATTRO code** system is planned.
- Includes access to restricted-access events and early Lumiros releases as they become available.

6. WS-20 — supply: 20 NFTs, distributed by invitation

- This category is intended for distribution to invited participants, rather than public sale.
- **Claim: 625,000 VIGRI per NFT.**
- Includes a planned voucher to purchase additional VIGRI at a **60% discount**.
- An expanded code system and **WS-key** are planned.
- Includes access to special sections and restricted-access Lumiros activities as they become available.

These parameters describe the category models and terms. Holding an NFT does not mean that all of its planned features are already available.

Voucher limits and validity periods, procedures for activating rights, vesting terms and the implementation status of the mechanisms are disclosed in the detailed descriptions of the relevant categories on vigri.ee. Not all provisions of the model have been implemented in smart contracts at this stage.

---

6. Claim / Discount Mechanics

The VIGRI model provides for two independent rights of an NFT holder:

- **Claim** — receiving the number of tokens specified for the NFT category.
- **Discount** — purchasing additional tokens at a discount through a voucher, where the category includes one.

Using a voucher does not reduce the basic Claim entitlement.

6.1. Claim — 100% of the Category Entitlement

Every VIGRI NFT card, including WS-20, includes the right to the full basic Claim entitlement specified in Section 5.3.

100% Claim means the entire number of tokens provided for the category. It does not mean receiving all tokens at once: distribution over time is envisaged for certain categories.

The number of tokens is determined using the calculation parameter of **€0.0008 per VIGRI** and is not recalculated when the SOL exchange rate or the market price of VIGRI changes.

Claim Reserve

The economic model allocates up to **15% of the total VIGRI supply** to Claim:

- total amount issued — **10,000,000,000 VIGRI**;
- maximum Claim reserve — **1,500,000,000 VIGRI**;
- maximum aggregate Claim entitlement if the entire planned NFT supply is issued, including WS-20 — **1,450,000,000 VIGRI**;
- difference between the reserve limit and the maximum obligations — **50,000,000 VIGRI**.

Covering the maximum Claim entitlement requires 1,450,000,000 VIGRI. This amount is within the model's reserve limit of 1,500,000,000 VIGRI. The calculation demonstrates that the allocated share is sufficient, but does not by itself confirm that tokens have actually been placed or locked in a separate reserve.

The Claim reserve forms part of the **30% public allocation**; it is not added on top of it.

Distribution Procedure

Tokens are intended to become available after TGE and the launch of the corresponding Claim mechanism.

For **Silver, Gold and Platinum**, the model includes vesting — gradual receipt of tokens under the category terms. Vesting determines the distribution schedule while preserving the full Claim entitlement.

At this stage, token lock-ups and vesting **have not been technically implemented**. Their description in this document reflects the distribution model.

6.2. Discount — Additional Tokens Through Vouchers

Vouchers are included in the **Bronze, Silver, Gold, Platinum and WS-20** categories.

A voucher gives the holder the right to purchase additional VIGRI:

- at a discount to the market price under the category terms;
- during a limited period after TGE and the launch of the voucher redemption mechanism;
- within the voucher's specified face value.

Discount percentages are listed in Section 5.3. The face value, validity period and redemption procedure are determined by the terms of the relevant voucher.

A voucher does not replace Claim or turn it into a choice between receiving tokens and obtaining a discount. It is an additional right included in the NFT category.

Within the economic model, vouchers fall under the community portion of the public allocation. Up to **15% of the total VIGRI supply** is allocated to this portion, shared with airdrop programmes, referral rewards and other activities.

This portion is accounted for separately from the Claim reserve, but together they form the overall **30% public allocation**. The number of tokens used for vouchers must remain within the portion of the model allocated to these mechanisms.

---

7. VIGRI Tokenomics

7.1. Basic Parameters

- **Token name:** VIGRI.
- **Ticker:** VIGRI.
- **Amount issued:** 10,000,000,000 VIGRI.
- **Blockchain:** Solana.
- **Early participation model:** an NFT presale with Claim rights and additional opportunities for holders according to their category.

The economic model is based on a fixed supply of 10 billion VIGRI. The launch model described here does not include closed private rounds with preferential terms.

Model Reference Value

A value of **€0.0008 per VIGRI** is used to calculate NFT entitlements.

At this reference value, the calculated value of the entire supply is:

> 10,000,000,000 VIGRI × €0.0008 = €8,000,000.

This is a notional valuation used in the economic model, not a confirmed market capitalisation or an amount of funds raised.

The €0.0008 parameter is used:

- to determine the Claim token entitlement for each NFT category;
- as a reference in the illustrative scenario for establishing the first liquidity pool.

It does not establish a guaranteed market price for VIGRI. Fixed Claim entitlements are not recalculated in response to changes in the market price.

Purpose of the Token

VIGRI is intended as a tool for:

- paying for goods, services and offerings within the application;
- providing financial support to clubs, studios, creators and community initiatives;
- participating in Lumiros cultural and social projects;
- rewarding participants;
- selected forms of participation in governance, if they are developed and implemented.

These capabilities have yet to be integrated into the application. Under the project model, holding VIGRI does not provide an equity interest or shares in a legal entity.

7.2. Token Allocation

The allocation model provides resources for meeting NFT obligations, establishing liquidity and developing the application and ecosystem.

Purpose	Share	VIGRI Tokens
Public allocation	30%	3,000,000,000
Liquidity and exchange reserve	30%	3,000,000,000
Ecosystem development	15%	1,500,000,000
Founder’s reserve	10%	1,000,000,000
Strategic partners and ambassadors	10%	1,000,000,000
Future initiatives	5%	500,000,000
Total	**100%**	**10,000,000,000**

1. Public Allocation — 30%

This includes two separate portions:

- Up to **15% of the total supply** — the Claim reserve for all NFT categories, including WS-20. The maximum obligations amount to **1,450,000,000 VIGRI**, within the reserve limit of **1,500,000,000 VIGRI**.
- Up to **15% of the total supply** — discount vouchers, airdrop programmes, referral rewards, marketing campaigns, including VIGRI Mystery Draw, and other community activities.

Tokens used for vouchers are accounted for separately from Claim. Both portions form part of the overall 30% public allocation.

2. Liquidity and Exchange Reserve — 30%

The total token allocation for the first liquidity pool and the subsequent development of trading infrastructure.

In the illustrative scenario in Section 7.3, only part of this allocation is used for the first pool. The remaining tokens are intended as a reserve for adding liquidity gradually and establishing additional pools.

3. Ecosystem Development — 15%

Intended for developing and maintaining the VIGRI application and related Lumiros services, including infrastructure, security, integrations, research and new tools for participants.

4. Founder's Reserve — 10%

Intended to provide long-term incentives for the founder. The model includes restrictions on unlocking, as described in Section 8. The technical implementation of these restrictions has yet to be completed.

5. Strategic Partners and Ambassadors — 10%

Intended for cultural, sports and institutional partners, ambassadors and key participants.

Vesting and publicly disclosed terms are planned for these allocations.

6. Future Initiatives — 5%

A reserve for new initiatives aligned with the objectives of VIGRI and Lumiros, including additional NFT formats, offline projects and international collaboration.

This is the allocation structure envisaged by the model. The actual placement of tokens, movements of reserves and lock-up status must be verified separately.

7.3. Use of NFT Presale Proceeds and Establishment of Liquidity

The percentages in Section 7.2 refer to **VIGRI tokens**. This section concerns **funds received from NFT sales**. These are different parts of the economic model.

NFTs are sold for SOL. To illustrate how receipts are allocated, the following figures use the earlier euro-denominated scenario based on the notional values assigned to the NFT categories.

The amounts of **€450,000** and **€700,000** are not funds actually raised, guaranteed sales results or established minimum fundraising thresholds. Actual receipts depend on the number of NFTs sold, their SOL prices and the SOL/EUR exchange rate.

Group 1: Tree / Steel, Bronze, Silver

Illustrative receipts scenario — **€450,000**.

The planned allocation proportions are:

- **80% — establishing liquidity and its reserve:** €360,000 in the illustrative scenario.

- **20% — operating expenses and development:** €90,000 in the illustrative scenario.

First Liquidity Pool

In this scenario, the first pool receives:

- **400,000,000 VIGRI** — 4% of the total supply;
- a paired asset worth **€320,000** at the time the pool is established.

These 400 million VIGRI form part of the overall 30% allocation for liquidity and the exchange reserve.

The calculated initial ratio is:

> €320,000 / 400,000,000 VIGRI = €0.0008 per VIGRI.

This is the ratio when the pool is established, not a guarantee of the subsequent price. The market price will change during trading; if SOL is used, its euro equivalent is also affected by the SOL/EUR exchange rate.

Of the €360,000 envisaged in the scenario, **€40,000 remains in reserve** after the first pool is established.

This reserve may be used for additional liquidity and, where liquidity needs are adequately covered, for project development, with a public explanation of such decisions.

The **80% / 20%** split applies to actual Group 1 receipts. Receipts above the illustrative scenario increase the reserve and the operating budget.

Group 2: Gold, Platinum

Illustrative receipts scenario — **€700,000**.

The planned allocation proportions are:

- **20% — a reserve for additional liquidity and development:** €140,000 in the illustrative scenario.
- **80% — application development, operating expenses and fulfilment of offline obligations:** €560,000 in the illustrative scenario.

The uses of the operating portion are described in Section 7.4.

The **20% / 80%** split applies to actual Group 2 receipts.

Combined Additional Reserve

In the scenario presented, this amounts to:

> €40,000 from Group 1 + €140,000 from Group 2 = €180,000.

The reserve is intended for:

- adding liquidity;
- establishing additional pools;
- supporting the operation and development of the application, provided that necessary liquidity requirements are covered.

Using part of the reserve reduces the balance available for other purposes. The same funds are not counted simultaneously as liquidity and as an operating budget.

The existence of a reserve does not guarantee that the token's market price will be maintained.

The actual scale of pool establishment is determined by available funds and the readiness of the technical mechanisms. Additional receipts do not change the fixed Claim token entitlements.

Funds above the illustrative scenario are directed to reserves and project development in accordance with the stated proportions and the rules governing use of the operating budget.

7.4. Operating Budget, Ecosystem Operator and Founder Remuneration

The ecosystem operator is **ADET Impex OÜ** (Estonia). The main expenses associated with the development of VIGRI and Lumiros are organised through this company.

Priority Areas of Operating Expenditure:

- development and maintenance of the VIGRI application and related services, including payments to the team and contractors;
- infrastructure, security and technical maintenance;
- design, production and delivery of physical NFT cards;
- legal, registration and administrative expenses;
- advice on compliance, taxation and digital asset regulation;
- marketing and engagement with the community and partners.

In the illustrative scenario, the operating portion consists of **€90,000 from Group 1** and **€560,000 from Group 2**. The actual budget is formed from funds actually received.

Founder Reimbursement and Remuneration

A limited portion of the Group 2 operating budget may be used for:

- reimbursement of the founder's personal funds previously invested in the development and launch of VIGRI / Lumiros;
- gradual repayment of personal obligations directly related to launching the project and maintaining the conditions necessary to continue work on it;
- remuneration for the founder's work on the project.

These payments are subject to the following restrictions:

- their sole source is the Group 2 operating budget;
- funds held in active liquidity pools and tokens in the Claim reserve are not used for these payments;
- the model's guideline is a limited share of the operating budget, up to **10–12% of the funds attributable to Group 2**;
- payments are made gradually, taking into account actual receipts and the project's needs;
- the purposes and amounts of payments are recorded in reports on the use of funds.

Payments may include repayment of the founder's existing obligations and support for uninterrupted work on the project. When planning them, obligations to participants and necessary development expenses retain

priority.

This monetary budget is accounted for separately from the **10% token allocation to the founder's reserve**, described in Section 8.

---

8. Founder's Reserve and Long-Term Incentives

The operating budget described in Section 7.4 is intended for the project's current expenses, reimbursements and remuneration for work. The founder's token reserve is accounted for separately and provides for the founder's long-term participation in the development of VIGRI and Lumiros.

The project has one founder, who financed its early development with personal funds.

Reserve parameters:

- **Size:** 10% of the total supply — **1,000,000,000 VIGRI**.
- **Recipient:** the founder as an individual.
- **Purpose:** a long-term resource for participation in ecosystem development and founder remuneration.
- **Schedule:** unlocking in two equal portions after four and eight years have elapsed from TGE.

At this stage, the technical lock-up and vesting of this reserve **have not been implemented**. The restrictions envisaged by the model are described below.

8.1. Unlocking Schedule

During the First Four Years After TGE

The model provides for the entire reserve of **1,000,000,000 VIGRI** to remain locked.

During this period, reserve tokens are not intended for sale, transfer to other participants or payment of operating expenses.

After Four Years Have Elapsed

The first half is scheduled to unlock:

- **500,000,000 VIGRI**;
- **50% of the founder's reserve**;
- **5% of the total token supply**.

Under the model's terms, this portion may be used only for:

- rewarding key investors and partners;
- supporting participants who have made non-financial contributions and cultural leaders;
- reinvesting in VIGRI and Lumiros projects;
- partial personal remuneration for the founder, while maintaining the priority of the ecosystem's interests.

The second half of the reserve remains locked until eight years have elapsed after TGE.

After Eight Years Have Elapsed

The remaining **500,000,000 VIGRI** — another **5% of the total supply** — is scheduled to unlock.

The founder may then freely use this portion of the reserve, including for personal remuneration and further reinvestment.

Unlocking makes tokens available for use and does not in itself imply their immediate sale.

8.2. Relationship to the Operating Budget

Monetary reimbursements and founder remuneration follow the rules in Section 7.4.

The token reserve does not replace the operating budget. Before the scheduled unlocking dates, it cannot be used for current expenses or repayment of the founder's obligations.

Operating expenditure and movements of reserve tokens are accounted for separately.

8.3. Transparency and Implementation

Implementation of the model envisages:

- placing the reserve at a separately identifiable public address;
- technically locking the tokens according to the schedule;
- publishing the address, locking mechanism and schedule before TGE;
- publicly specifying the TGE date from which the four-year and eight-year periods are calculated;
- announcing planned transfers from the reserve in advance, with an explanation of their purpose;
- enabling published information to be compared with actual token movements on the blockchain.

The description of this model in the litepaper does not confirm that a lock-up is already in effect. Once implemented, information will be published to allow compliance with the schedule to be verified.

---

9. Long-Term Offline Initiative: A Sports and Dance Centre

One of the long-term objectives of VIGRI and Lumiros is to establish an **International Sports and Dance Training and Rehabilitation Centre** on the coast of the Gulf of Finland in Estonia.

The centre's concept connects community development with practical support for people whose professional activities involve high levels of physical and psychological demands.

9.1. Concept

- **Proposed location of the first centre:** Estonia, on the coast of the Gulf of Finland.
- **Main areas of focus:** training, recovery, injury prevention and psychological support.
- **Target audience:** professional athletes, ballet dancers and other dance professionals, as well as people in other highly demanding professions.

The specific range of services, site requirements and operational arrangements will require separate development with relevant specialists.

9.2. Development Principles

Implementation envisages sequential preparation: selecting a site, developing the project, securing funding, construction and opening.

For each stage, the project envisages publicly describing:

- goals and completion criteria;
- expected expenditure by major category;
- funding sources;
- arrangements for managing funds and overseeing their use;
- results achieved and actual costs.

Where blockchain is used to raise funds, the relevant addresses are intended to be published. Reporting should show how receipts are subsequently used, including expenditure outside the blockchain.

Shared control mechanisms for funds, including the use of multisignature wallets, form part of the planned project arrangements.

9.3. Community Participation

Supporting the centre does not involve promises of financial returns.

Participants may be offered non-financial benefits, such as participation in selected events, priority booking, symbolic status and other forms of recognition for their contributions. Their scope and terms must be described before the relevant support programme is offered.

The centre remains a **long-term objective**. Its implementation depends on available resources, partners, the development of VIGRI, community interest and compliance with the requirements applicable to the centre's activities.

This version of the document sets no fixed dates for construction or opening.

---

10. Current Status and Project Development

VIGRI is developing gradually, taking into account the founder's capacity, available resources, partner participation and community interest. This version of the document does not establish a fixed launch calendar.

10.1. What Already Exists

The vigri.ee website is operational, with a user dashboard and the ability to purchase NFTs. Minting of NFT cards on Solana has begun.

A total of **10,000,000,000** VIGRI tokens has been issued. Their practical use within the project and the distribution mechanisms described in this document require further development. Token lock-ups and vesting have not yet been technically implemented.

10.2. Main Priority

The immediate priority is to create the VIGRI application as a specialised messaging application and social network for sports, dance and the arts.

Development envisages progressing from core communication and community features to additional opportunities for participation and financial support. The scope of the initial versions will be determined by users' practical needs and implementation capacity.

Feedback from clubs, studios, creators and community members is intended to help determine the next development tasks.

10.3. Development of Related Areas

Work on the NFT collection, original images, Reveal, Claim and voucher mechanisms remains part of the project. These areas may develop alongside the application as the necessary solutions and resources become available.

Preparing liquidity and launching token trading require a separate financial and technical assessment. The illustrative scenarios in Section 7 describe the economic model and do not in themselves mean that the corresponding funds have already been raised.

The offline initiative described in Section 9 remains a long-term objective requiring separate preparation, partners and funding.

10.4. Transparency of the Process

Information about the project's development is published as results become available, distinguishing what has been implemented, what is being tested and what remains a concept or model.

Before new mechanisms are launched, their terms, technical readiness and procedures for use must be described separately.

The absence of a calendar-based roadmap does not cancel the NFT holders' rights provided for by the model, the token allocation parameters or vesting schedules measured from TGE. These terms are described in the relevant sections of this document.

---

11. Legal Information and Risks

11.1. Purpose of the Document and Legal Status

This litepaper describes the VIGRI concept, the project's current status and its economic model. It does not constitute personalised investment, legal or tax advice.

Under the model described, holding VIGRI or an NFT card does not provide an equity interest in the operator or other legal entities, rights to their profits or dividends, or corporate governance rights.

The legal classification of the token, NFTs and associated rights is determined by their actual characteristics and applicable law. The labels "utility token" and "NFT" do not, by themselves, establish legal status or exempt them from regulatory requirements.

This litepaper does not replace documents and procedures required for the relevant type of offering or activity, where such requirements apply.

11.2. Participant Rights and Readiness of Mechanisms

NFT holders' rights are described in Sections 5 and 6:

- Claim provides for receipt of the number of VIGRI tokens specified for the category;
- a voucher, where included in the category, provides a separate right to purchase additional tokens at a discount;
- collectible, physical and other features are determined by the terms of the relevant category.

The description of a right or planned feature does not mean that the mechanism for using it has already been launched. The technical readiness of Claim, vouchers, vesting, Reveal and other features must be stated separately.

The reference value of **€0.0008 per VIGRI** is used in the economic model. It is not a guaranteed market price, a buyback commitment or monetary backing for the token.

11.3. Main Risks

Acquiring and using digital assets involves risks, including:

- partial or total loss of their market value;
- a lack of liquidity, buyers or opportunities for resale;
- transfer restrictions on certain NFT categories;
- smart contract errors, infrastructure failures, loss of keys and unauthorised access to a wallet;
- delays, changes or discontinuation of the development of individual features due to a lack of resources or technical and legal constraints.

The project does not guarantee returns, price appreciation, exchange listings or the ability to sell an asset at a desired price.

Disclosure of risks does not cancel obligations undertaken by the project or limit participant rights or operator liability that cannot legally be excluded.

11.4. Participant Verification

The project provides for participant identification and verification procedures, including KYC/AML, where required by applicable law, the requirements of the providers involved and the terms of the relevant transaction.

Verification may be mandatory for certain NFT categories and features. Applicable requirements and restrictions must be available to the participant before the relevant transaction.

Personal data is processed with regard to applicable data protection requirements and the published privacy policy.

11.5. Updates to the Document and Terms

The litepaper may be updated to reflect the project's actual status, clarify descriptions and account for changes in legislation.

Material changes are published openly, identifying the document version, date, nature of the changes and their impact on participants.

Publication of a new version does not in itself cancel previously undertaken obligations or give the project the right to arbitrarily reduce Claim entitlements or other rights attached to NFTs already purchased.

Changes affecting participants' existing rights require compliance with applicable law and the terms of the relevant transactions.
